

# SINC-LINK

Vol. 7 No. 3 May-June '89

SINC-LINK IS A PUBLICATION OF THE TORONTO TIMEX-SINCLAIR USERS CLUB AND IS ISSUED 6 TIMES A YEAR. COPIES OF THE NEWSLETTER ARE \$1.50 EACH FOR NON-MEMBERS. CLUB MEMBERS RECEIVE FREE COPIES AS PART OF THE \$20.00 ANNUAL MEMBERSHIP FEE. A NEWSLETTER SUBSCRIPTION ONLY IS AVAILABLE FOR \$12.00.

NEWSLETTERS ARE EXCHANGED, FREE OF CHARGE, WITH OTHER TIMEX-SINCLAIR USERS GROUPS.

PLEASE CREDIT THIS PUBLICATION AND THE AUTHOR IF YOU COPY MATERIAL.

THE CLUB MEETS ON THE FIRST WEDNESDAY OF EACH MONTH AT FOREST HILLS COLLEGIATE INSTITUTE, 730 EGLINTON AVE. W., TORONTO.

SEND CORRESPONDANCE TO:

Attention: SINC-LINK EDITOR

## Editorial

I was going to start off by apologizing for getting this issue out a little late. Then I thought, "Why am I apologizing? I haven't done anything wrong." So here isn't an apology.

The reason this issue is a couple of weeks late is because several of the club members, myself included, went to the Capital Area Timex Sinclair (CATS) Users Group Computer Fest in Washington, D.C. Since the fest occurred after the May 5th TTSUC meeting and normal Sinc-Link release date, the Exec felt it better to delay the May-June issue and to include members' comments about the fest in this issue rather than reporting on it in the July-August issue. Just trying to stay current.

### CATS Fest

The big news is that six of our members made our respective ways down to Washington for an enjoyable if rushed May 5th, 6th & 7th weekend. I would have to say that the fest was a success for the organizers with visitors and exhibitors from as far away as British Columbia, Oregon and California.

The fest was a success for us too. Each of us spent more than we planned on, but not one of us regretted doing so. I am now the owner of a used QL, a graphics tablet with software, a fabulous RGB monitor, ZX81 hardware plus assorted software, magazines and books. A financial disaster but I'm still grinning so it can't be that bad.

Sad to see the departure of a vendor such as Zebra Systems, thanks for years of great hard-and-software support.

On a lighter note, Hugh Howie is particularly happy about this fest. He now has four new QL members!

See George's comments for more CATS Fest info.

Well done, CATS!

## Newsletter

In case you haven't noticed, we are presenting another large issue. I am really pleased with the response from our writers. In fact the only reason why this issue isn't larger is because its weight would cost us more in postage prices. So to those writers whose articles don't appear in this issue, don't worry, your names will appear in print in the July-August newsletter.

I'm also happy to announce that this edition was assembled by Renato Zannese and Greg Robins. This makes my job of producing the newsletter much easier. I welcome any aid or suggestions which will improve the quality of our publication. Just let us know with a card or a letter.

### QLers Note

Last issue we ran a questionnaire asking QLers to comment. One of the questions may have been misleading. Allow me to point out that our QL program library (as well as the ZX81 and TS2068 library) contains only public domain programs. If Quanta members wish to exchange cartridges they do so privately. The Toronto Timex-Sinclair Users Club will not knowingly distribute copywritten programs without prior permission from the authors.

### Non-Canadian Readers Take Note!

We have been receiving a lot of cheques written out to non-Canadian banks. These are usually for about \$2.00 for issues of Sinc-Link. Since our bank charges us more to process the cheque than they are worth I would ask that readers use a POSTAL MONEY ORDER instead of a cheque. Also, please do not send postage stamps. We cannot use foreign stamps. Thanks for your cooperation.

BOB'S NOTEBOOK

At the club meeting in April, I promised a utility which would allow the data in my disk indexer (see Sinc-Link Nov-Dec 87 p.6) to be printed on the wide printer with eight entries per line in condensed font. Listings 1 and 2 below will do the job. But here are some explanatory notes.

Listing 1 is straight-forward and should present no problems.

Listing 2: Variable <ff> means form feed and controls the ejection of the paper after 55 lines are printed. You may wish to alter this parameter to some other number of lines. Variable <lf> means line feed and is used to insert a line feed after eight records are printed.

In line 3001, the address 37825 equals 37799 + 26 so as to skip over the first two d\$ items which contain the <SEARCH IS COMPLETED> message. The address 37799 is contingent upon your compilation coming up with 37797 as the start of the data area for d\$ in the compilation. If it is any other value, you will have to adjust the 37825 & 56024 addresses accordingly.

Line 3007 inserts a space after each file name to separate it from the disk number; similarly, line 3017 inserts two spaces between records. Line 3010 skips over the asterisks in the d\$ array; line 3012 stops action and returns to the loader at line 1100 when it encounters a space in the second place in the file name.

In the Jan-Feb 1989 issue, I provided a utility which would allow the sorting of lists (of information) entered into the Tasword. As I explained before, such lists can be birthdays and anniversaries, things to do, disk names & numbers, anything you like as long as the entries do not exceed 64 characters in length.

In listing 3 and 4 below, you will find a similar utility for doing the same thing with MSCRIPT. Listing 3 is the loader and remains in BASIC, while listing 4 is best compiled using Timachine. Here are some notes on these two programs.

If you don't have the taswide utility, you should leave out line 98 in listing 3 and make line 240 in listing 4 read: <CLS: BEEP oa, VAL "10": FOR i=n TO s-1: PRINT d\$(i): NEXT i>.

In line 510 in listing 3, the PEEKs get the value of variable <b> in the compiled code <mssort.Cc>; <b> is the length of code to be saved. If you get a different location for variable <b> when you do your compilation, you should change these PEEK addresses accordingly. In line 100, I put the words <MSCRIPT SORT> in inverse characters and followed these with 24 spaces. I also put the words <BLOCK SAVE> in inverse characters in line 120 of listing 4.

Lines 94 and 530 are set up to return action to my Randisk; you may change these to go back to the current menu in your disk drive by changing <GO TO 4> to the drive number of your choice.

This is a little postscript for indxLP above. Use this  
 listing to change the line spacing and when used with  
 condensed font, this will allow up to 1400 records to  
 be printed on one sheet of paper (both sides). The  
 DATA in lines 200 and 300 are for my Fastext 80  
 printer. Use your printer's manual to get the  
 equivalents for your machine.

# Modifying ARTIST II for the LARKEN DISK SYSTEM

Artist II is a great Spectrum graphic program. It has so many features that, it is the best program available.

Below is the basic listing showing the necessary modifications required to be used with the LARKEN DISK SYSTEM. Enter the lines as indicated and delete the other lines in the program.

Find the menu which has the exit to basic function. Edit the lines and then ENTER GOTO 1. Do an NMI of the Program. Rename the program to ARTIST.D2 . That's all.

The program has error proofing in the SAVE, LOAD and ERASE features. The program can send a copy to a large printer, but it has to be EPSON compatible.

Version LKDOS 1.0 04/89

A disk copy (5 1/4 ssdd) is available for \$7.00

QL QL

IN OUR LAST ISSUE I WAS TELLING YOU ABOUT PURCHASING AN R. G. B. MONITOR THAT DIDN'T WORK WITH MY QL. I AM HAPPY TO BE ABLE TO TELL YOU THAT AFTER MUCH EFFORT BY MANY MEMBERS IT WORKS GREAT. FROM THE DATE OF PURCHASE TO DATE OF OPERATION WAS FORTY DAYS, I'M NOT SURE WHETHER THATS A SIGN OF SOMETHING OR NOT.

THE PROBLEM WAS MAINLY IN THE CONNECTION OUT OF THE QL. FROM THE LITERATURE IT DEPENDED WHAT MODEL OF QL YOU HAD. MY PERSONAL OPINION IS, !I DON'T KNOW!. AT THE MARCH MEETING OF THE CLUB IT WAS DECIDED TO HOLD A MEETING OF THE QL GROUP AT HUGH HOWIE'S HOME SO THAT THE CLUB MEMBERS IN THE HAMILTON BURLINGTON AREA COULD ATTEND. HUGH HAD ALSO PURCHASED THE SAME MODEL 'RGB' AS I HAD, BUT HIS WAS WORKING GREAT. WE ARE AGREED THAT THE CREDIT FOR THIS GOES TO SCHENNELLY STOUGHTON, CLUB MEMBER FROM LINDSAY, WHO MADE UP HUGH'S CABLE. IN TALKING WITH THE GUYS IT WAS AGREED THAT I WOULD TAKE MY CABLE TO THE MEETING TO SEE IF ANY ONE HAD AN IDEA AS TO WHY I WAS HAVING SO MUCH DIFFICULTY. AFTER THE BUSINESS PART WAS OVER JEFF TAYLOR (CLUB PRES.) SENEN RACKI AND MIKE FERRIS (QLers FROM HAMILTON), SENEN ALSO BOUGHT ONE OF THE SAME MONITORS AND WAS HAVING PROBLEMS USING THE TV MODE. WITH THE USE OF HUGH'S EQUIPMENT THEY WENT TO WORK ON THE CABLE AND AFTER A FEW ATTEMPTS THEY HAD MY CABLE WORKING ON HUGH'S SET. 'THANKS FELLOWS.

JEFF AND I LEFT THE MEETING AROUND 10:30. JEFF WAS SURE I WOULD WANT TO CALL GEORGE CHAMBERS, ON ARRIVAL AT TORONTO, TO GO TO GEORGE'S AND TEST THE CABLE ON MY UNIT. AFTER MUCH DISCUSSION I CONVINCED HIM, NOT REALLY, THAT IT COULD WAIT UNTIL GEORGE WOULD BE FREE TO SPEND SOME TIME AT IT. AS IT TURNED OUT, MUCH TIME WAS NEEDED. THE CABLE DIDN'T WORK ON MY SET. THE SIGNAL WAS COMING THROUGH BUT IT WOULD NOT SETTLE DOWN TO A FIRM PICTURE. I POINTED OUT THAT HUGH HOWIE, ON ONE OF OUR OTHER ATTEMPTS, WONDERED ABOUT THE CONNECTION AT THE MONITOR END OF THE CABLE. GEORGE CHECKED THIS AGAIN BUT IT MADE NO DIFFERENCE. THEN HE DECIDED TO CHECK UNDER THE UNIT. WHEN HE TILTED THE UNIT FORWARD THE DOUBLE WINDOW COLOUR AND ALL APPEARED AS IT SHOULD. GEORGE PUT A CLAMP ON THE CABLE AND IT HAS WORKED EVER SINCE. THANKS GEORGE AND THANKS MARJORIE, (MARJORIE GEORGE'S WIFE). WE SPENT SO MUCH TIME GETTING THE UNIT GOING MARJORIE HAD US STAY FOR SUPPER. SEE WHAT FAITH CAN DO (WITH LOTS OF HELPERS). IT WAS WORTH THE WAIT. IT IS BEAUTIFUL. THE COLOURS ARE TREMENDOUS. THE TEXT IS VERY SHARP. THE PRICE WAS RIGHT.

P.S. IT IS NOW ENCASED IN A SUIT BOX SPECIALLY CUT AND PASTED. W K  
(BILL) LAWSON

DO YOU KNOW THAT THE KEYWORD - LIST - CAN GIVE YOU A HARD COPY OF A PROGRAM LISTING? YEP, YA GOTTA HAVE A PRINTER.TRY IT, WITH OR WITHOUT LINE NUMBERS.

A 288 USERS GROUP  
by G. Chambers

One of our members, Phil Hudsmith, tells me there is a Sinclair 288 computer users group in England, which welcomes overseas members.

They put out a newsletter called the 288 EPROM. Cost for a year subscription (6 issues) to the newsletter is 14 pounds for overseas subscribers. (For some reason the subscription price to USA is 12 Pounds. Doesn't seem right, does it?)

Anyway, for anyone who is interested, the address is:

Dept S - 288 USERS CLUB  
68 Wellington  
Long Eaton,  
Nottingham,  
United Kingdom NG10 4NG  
\*\*\*\*\*

LARKEN-CRACKING SPECTRUM  
PROGRAMS  
BY G. CHAMBERS

In the last issue I described how to crack the program TECHNICIAN TED. It used a quite involved procedure to save the code from disk to tape, then back into the computer. Since then I have written two utilities which simplify the process considerably.

The first programs is called "crackr.B1". It searches the disk for the named program, then saves it to tape on a track-by-track basis. The first track is saved starting at address 24000 (I use 9-track NMI-saves).

A companion utility, called "saver1.B1", loads the tape back into the computer, from whence it can be saved to disk, or tape.

The "saver1.B1" utility has several interesting features about it. Because the program to be loaded from tape starts at 24000, there is not much room for a BASIC loader program. This was solved by having the Basic program load some m/c into the printer buffer at address 23296. This m/c does two things. Part of the code contains a LINE DELETE function, while the balance of the code is a tape loader utility.

After installing the m/c the Basic program makes a USR call to delete all but one key line of itself, lowers RAMtop to address 23999, then makes a second USR call. The second USR call, to address 23300, loads the programs previously saved to tape, back into the computer.

All that needs to be done now is to locate the starting USR address. The hard part, that is!

\*\*\*\*\*

# INTERFACE FOR RAM IN T/S 2068 I/O PORTS

Larry Crawford  
357 Reynolds Rd  
London Ontario  
Canada N6K 2P8

Expanding memory into the EXROM and DOCK banks is reasonably simple (SWN 2/3, 3/4). However, one must be very cautious when enabling chunks of RAM in these banks to avoid interfering with the operation of the system. For example, if you want to use any of the ROM routines, you will need to be sure that the appropriate chunks of Home bank are enabled before you call them. Some hardware add-ons also use chunks of EXROM and Dock banks and could get in the way. There is also the complication of an Interruption fielder which we needn't go into here.

The simplest way around these problems is to leave chunks 0 to 3 of Home bank enabled at all times and to enable only chunks 4 to 7 of any other banks added. With an appropriate interface, Expansion banks can be added and controlled through the I/O ports. Nineteen ports are used by the 2068 system, 4 by a MODEM, and a few others may be used by other hardware, leaving over 200 ports available for RAM. Even at only 32K per port, that amounts to over 6.5 MEGabytes which can be implemented without getting in the way of the system's normal operation.

Each Expansion bank enabled in this way acts exactly like a Dock bank. Therefore, its active chunks can be controlled through I/O port 244. For example, OUT 2.0 : OUT 244.16 would enable chunk 4 of Expansion bank 02. OUT 244.0 would disable it. The Dock bank has priority over Home Bank. Thus any chunks enabled in an Expansion bank automatically disable the corresponding chunks in Home bank. OUT 244.240 would enable chunks 4 to 7 of an active Expansion bank.

The circuit given here uses a 74LS138 to decode the I/O port addresses. It can therefore control 7 additional banks of memory (224K at 32K per bank). A 74LS154 decoder would permit 15 Expansion banks for 480K of extra RAM. Additional decoders could be added, of course, to control even more banks.

## HOW IT WORKS

When the OUT command is used in BASIC, or the OUT (C),A instruction in M/C, the number of the I/O port is put onto address lines A0 to A7. Then the IORQ and WR lines go LOW simultaneously. When they are both LOW, the first 74138 (U1) decoder is enabled. It decodes address lines A0, A1, & A2 and pulls one of its 8 outputs LOW. This LOW output is used to select one of 7 possible Expansion banks.

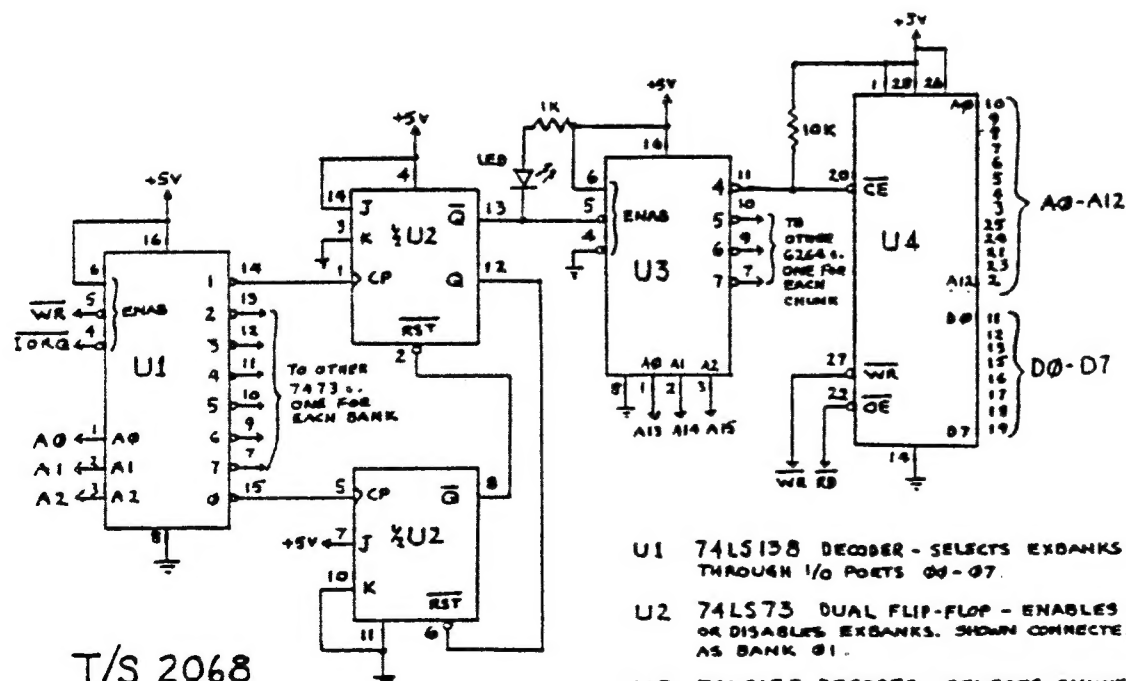

For example, if Expansion bank 01 is to be enabled, OUT 1.0 would cause pin 14 (output 1) of U1 to go LOW. This transition from HIGH to LOW causes the Q NOT output (pin 13) of the flip-flop (U2) to go LOW. This in turn enables the second 74138 (U3). A small LED connected to pin 5 indicates that the bank is active. Its address pins are connected to A13, A14 & A15. Thus it acts as a chunk decoder, i.e. output 4 enables chunk 4, etc. This decoding is for memory locations, not the chunk selection register. In the command OUT 1.0 that was used, the 0 is a dummy parameter needed to satisfy the structure of BASIC. Any value up to 255 could have been used. In M/C, the instructions LD C.01 and OUT (C),A would accomplish the same thing. There is no need to assign a value to register A. It is not decoded.

To disable the Expansion bank, OUT 0.0 causes pin 15 of U1 to go LOW (and incidentally pin 14 to go HIGH). This forces pin 8 (Q NOT) of the second flip-flop of U2 to go LOW. The first flip-flop is RESET, causing pin 13 to go HIGH thus disabling the chunk decoder. All its outputs go HIGH, disabling all the 6264 SRAMs connected to it. An OUT 244.0 will now return the computer to normal Home bank operations.

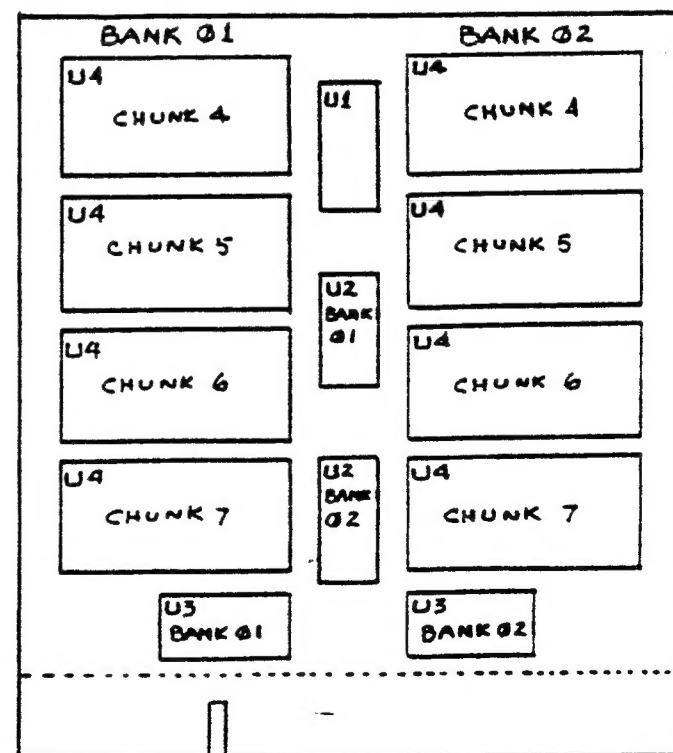

By connecting pin 27 of the 6264 sockets to the 5v rail instead of the WR NOT line, it is possible to install 27128 EPROMs instead of SRAMs. In this way, all sorts of M/C routines could be called up with a minimum of fuss.

## CONSTRUCTION

A 4"x 4.5" board will hold 64K. I used a one-sided board with a 4"x 0.5" strip shaved to half thickness glued into a matching notch in the main board to make the necessary two-sided edge connector. All the tracks possible were laid out including solder pads along the top edge to make it easy to attach a second board behind the first with short jumpers. The second board will not require U1 nor edge connectors. After etching and installing the sockets and bypass capacitors, I made the rest of the connections with wire wrap wire soldered point-to-point. I sprayed the bottom of the board with clear lacquer to hold the numerous little wires in place. It plugs into an Oliger expansion board slot.

- U1 74LS138 DECODER - SELECTS EXBANKS THROUGH I/O PORTS 00-07.
- U2 74LS73 DUAL FLIP-FLOP - ENABLES OR DISABLES EXBANKS. SHOWN CONNECTED AS BANK 01.
- U3 74LS138 DECODER - SELECTS CHUNKS OF EXBANK.
- U4 6264 8Kx8 SRAM. SHOWN CONNECTED AS CHUNK 4.

EXPANSION BANK INTERFACE COMPONENT LAYOUT

T/S 2068  
EXPANSION BANK  
INTERFACE

ALL YOU EVER WANTED TO KNOW ON  
THE CARE AND FEEDING OF YOUR  
DISK DRIVE(S)

A review of two manuals - DISK  
SERVICE MANUAL III and THE DISK  
DRIVE TUTORIAL both written by  
John J. Williams, MSEE, published  
by CONSUMERTRONICS CO., 2011  
Crescent Dr., P.O. Drawer 537,  
Alamogordo, New Mexico 88310 USA

When I first entered the wonder  
world of the disk drive; I felt  
as though I had entered a whole  
new world that spoke a foreign  
tongue. Having a curious mind, I  
learned about TT/SUG and joined  
hoping to be enlightened in the  
use of this wonderful addition  
to my 2068. The more I learned,  
the more interested I became in  
just how this equipment worked.  
I asked George Chambers if he or  
someone in the Club knew of any  
books or manuals concerning the  
disk drive units. By return mail  
he sent me an advertisement from  
CONSUMERTRONICS and I sent for 2  
of their publications.

DISK DRIVE TUTORIAL (2nd Edit.)  
is a 23 page manual that starts  
out in very general terms and  
tells about different drives and  
disk sizes and adds some advice  
on what you can do and what you  
shouldn't do yourself regarding  
servicing your disk drive.

Chapter 2 gives a short history  
of disk drives and the companies  
that make them. The various type  
of drives from the old 8 inch to  
the newer 3 inch disk drives are  
explained as well as the number  
of tracks that have evolved.

Mixing and matching of drives is  
dealt with and what can happen  
if you try to format a disk to  
more tracks than a disk can read  
or write and the damage it can  
do to your drive unit head. The  
stepper and spindle motors are  
explained in detail as is the  
cone lever assembly. Each of the  
chapters is well covered with  
diagrams and picture of the item  
being discussed. These are very  
readable diagrams. Unlike so  
many "How To" manuals.

Chapter 3 gets into detail of  
the disk itself - how the tracks  
are set and how the sector on a  
disk is arranged. Even a tip on  
how to modify a disk if you have  
a 55 drive and want to use the  
other side of a DS disk to save  
50% of your disk price!

Chapter 4 goes into some of the  
technicalities of interfacing. A  
sequence of Controller operation  
is gone through step by step and  
diagrams of several brands of  
interfaces are described.

Chapter 5 describes the format  
process and explains the anatomy  
of a disk with blow up diagrams.  
IBM, APPLE and COMMODORE format  
families are discussed with the  
differences described. Clock and  
data timing charts are clearly  
illustrated along with density  
charts for single and double  
density and 1 or 2 sided disks.

Chapter 6 gets into compatabil-  
ity or the incompatibility of one  
system to another. The uploading

and downloading using the modem  
for data files. Protection types  
such as passwords or access code  
and the use of bogus sectors and  
the problem of preventing honest  
backup for the user are brought  
out in this chapter. A section  
called COPY-BY-FILE vs. BACKUP  
describes the differences in the  
two methods of copying from an  
original disk.

Chapter 7 covers recommendations  
in 19 instances with names and  
addresses of suppliers of disk  
drives and disks as well as the  
names and addresses of repair or  
maintenace firms.

CONSUMERTRONICS CO. repairs disk  
drives FREE! They diagnose the  
problem and repair the unit and  
if it can be fixed it will be  
and then is shipped back. If it  
is not repairable they will send  
it back to you. They do this to  
improve their expertise in this  
area. They do NOT sell drives or  
parts. They also accept broken  
drives, parts or manuals so they  
can further educate THEMSELVES!

All in all - this is a very good  
tutorial and well worth the cost  
involved.

\*\*\*\*\*

DISK SERVICE MANUAL III is a 38  
page manual plus an 8 page DISK  
DRIVE MANUAL plus an 8 page DISK  
ADDENDUM.

A list of the table of contents  
pretty well covers this superb  
manual:

Chap. I	General
II	Operation advice
III	Error messages
IV	Diagnostics and Troubleshooting
V	Maintenance
VI	Speed Adjustment
VII	R-W Head alignment
VIII	Electronics & Repair
IX	Miscellaneous repair
X	Drive test station
XI	Repair techniques
XII	Drive analysis software critique
XIII	Drive modifications
APPENDIX A	-- GLOSSARY

This is a real nuts and bolts  
manual for those that are really  
interested in what takes place  
inside the disk drive and what  
to do when something goes wrong.  
AND not just when something does  
go wrong but how to prevent some  
of those things from going wrong  
by preventative maintenance.

Again there are good diagrams as  
well as photos of drive units. A  
number of charts and exploded  
views of the drive help identify  
the parts under discussion. The  
ADDENDUM is an update and the  
DISK DRIVE MANUAL has a listing  
of manufacturers addresses and a  
terminology list. A section is  
devoted to the cleaning of the  
drive and the adjustment of the  
drive speed. Lubrication and a  
paragraph on the Track 00 sensor  
and End Stop fill out this fine  
set of manuals.

Send for their catalog!

## QLips

by H. Howie

Don't know if you have ever noticed it, but the QL actually gives you warning some time before it runs out of memory.

If you are ever working on an Unexpanded QL, as you get near to the point of running out of memory, the QL starts to SLOW DOWN, not very noticeable at first, but eventually it is very obvious. The cursor just seems to chug along the line as if it were running out of steam, as it really is. Makes you want to give it a hand and move it physically.

The first time I came across this phenomena I was working QUILL, and in the process of editing the document, I became annoyed at the speed at which the cursor was moving along the line, it was painfully slow, so much so that I gave up and went to bed.

Next day I loaded the document in, and I thought it was not loading, thought I was going to get one of those wonderful messages 'Bad or changed medium', but eventually it was loaded and I continued working. A short time later it was dead slow and stop, then 'Out of Memory'.

Have you ever had one of those old spring loaded hand cranked record players? The spring is just about wound down, and the record goes slower and slower, and it goes out with a groooooaan. That's how it is. Don't mean to make you show your age! Wind up the old spring and listen to that 'Speedup' (We did not call it acceleration, in those days)

Luckily I had purchased the 512 Expanderam. So I saved the document, switched off, installed the 512, loaded up, and in seconds flat I was tearing around all over the place. Just like stepping out of an old clunker into a Jag and putting your foot to the floor. Whoosh...you're gone...

Which is one thing you should remember, if you are installing or removing anything in that expansion slot at the left of the QL. SWITCH IT OFF. There are so many pins and ports in that small area, it is very easy to make a slight error, (apart from the voltage surge) and bang goes a few more dollars.

Maybe that's what's wrong with me, I'm running out of memory, at least I am going a lot slower than I used to.

You know those fancy little doo-hickey things which you have, to carry all the info in your QL? Those gadgety little things you ALWAYS take out of their cases the wrong way up? Then You have to switch them around to insert them? Why not try this?

The end cap of your cartridge will probably, or should have, something on it to indicate what is the general idea of the contents. The case does not always have anything on it, as the cartridge does not always go into the case from which it came.

What happens? You put the cartridge in a case, put it on the shelf or whatever, and the next time you have to use it, to be sure you will pull out the cartridge upside down up or whatever, then you try to insert it in the drive, won't go, turn it around in your fingers, and start all over again.

Which reminds me of the chap up at the Trailer Camp where I spend a lot of time. Last year he was putting up his gazebo, and when it was finished he said he only made one mistake, he put the roof on inside out. It is one of those portable jobs made of plasticised fabric. My reply to him was that he had not put the roof on inside out, but UPSIDE DOWN. Now.....

With a toothpick or a very fine brush, (I prefer a toothpick), place a dot of white paint on the top of the cartridge case. A little dab'll do ya. The when you put the cartridge in the case with the dot on top, you know which way is UP to remove it. Pull it out and you are ready to place it right way up, straight into the drive.

No more fiddling, you can get on with the job of computing.

The Qler with a fairly large collection of cartridges, can have a bit of a problem storing them. One solution I came up with, was to make up a little shelf with spaces wide enough to hold the cartridges, but I still had the problem of finding that which I wanted at any given moment, they tended to drift away from where I last left them. I have examined them very carefully, and I don't see any legs, but they must have them the way they drift around.

Anyway, I thought it would be a good idea to make them up in bundles of three or four, in groups according to the class of material in them, this way there might not be so much tendency for them to get lost in the wrong pile.

I could glue them together, in which case I would be stuck with ('scuse the pun) the stack I had originally made, but I would not be able to reduce the size of the stack without some breakage of cases occurring. Then my mind drifted to something I had once seen in an office, used for sticking notes and notices on the walls. So I went out and found this stuff, and by taking a very small piece of it and sticking it on one case, placing the second case on top, with a very little pressure and a little twist, I was able to get a very firm bond, allowing enough space for any cartridge to be removed and replaced without any interference from its neighbour. A little piece about the size of a pea is sufficient to stick four or five cases together.

Each stack makes up an ALBUM of any given subject, making it easier to locate any given cartridge.

Easy to stack  
Easy to transport  
And no more wandering  
We really do hope.

A little twist help settle the cases together, and a little twist helps them come apart easily. Simple to use. No fuss. No muss. You can make an album as large or small as you desire.

The material is similar to playdough or plasticine, and is called "FUN-TAK" made by LePage, at least that is the material I used. Also very handy for sticking notes on the fridge or walls around your work station.

## A NOVELTY PROGRAM

This listing provides a novel title display, which can be incorporated into another program. It was supplied to the club by David Solly; though its original source is not apparent.

The program fires a program title onscreen in machine-gun fashion. The title can be up to 16 characters long. The title is placed in the first line of the program, and in this listing it is "BANG! YER DEAD!"

Line 60 places the title in the top left corner of the screen. It cannot be seen normally because the INK has been made the same colour as the PAPER. However the computer scans the area of the screen (the two FOR/NEXT loops, X and Y) for the presence of pixels operated by the wording, and if, in LINE 90, it detects an operated pixel the routine in LINES 100-140 comes into play to spell the wording out in the mid-section of the screen.

## PREDICTING LUNAR ECLIPSES

Mel Richardson

Throughout mankind's history, its' societies have placed great importance on the motions of the moon around our earth. From two to four times a year, the moon passes partly or wholly through the earth's shadow. Predicting this event was in times past, a feat of great power or at least thought really hard.

Nowadays, anyone with a microcomputer can do it. This must be significant but I will leave the reader to ponder or ignore the point and present a program that does all the magic.

The routine was assembled by Herbert Raab of Traun, Austria from various bits published in "SKY & TELESCOPE" magazine and converted to Sinclair Basic by me.

The program asks for a year then outputs a list of eclipses with the following details: the date and time of maximum eclipse, the magnitude into the penumbra and umbra if that occurs, the semiduration times and length of totality if that occurs. Magnitudes are in lunar diameters into the shadow zones and Semiduration times are the times from first contact with the shadow zone to maximum or from max to last contact. The time of maximum eclipse is given in Universal Time (UT) and subtracting your locations' hours West of Greenwich gives the local time. For instance 2300 hours UT minus 5 hours is 1800 hours EST.

Those who have a previous program from these pages called "NEW & FULL MOONS" can save slogging through all those numbers by starting with that and adding the lines shown here. The program here is "bare bones". It may be necessary to enter {CONT} for some years and the reader can add any displays that seem interesting. My own version uses "SRAM-HR" for a neat title page. I will submit this to the club library and anyone with SRAM-V3 can easily merge it. Those with V2 can do the same with direction from the documentation.

The results are accurate to a few minutes and I have included one for you to check your results against.

TEC-200 PRINTED CIRCUIT TRANSFER FILM

Product Review....R. Bruneau

TEC-200 Film is a specially coated plastic film that can have an image photocopied on to it. The photocopied image can then be transferred to a bare printed circuit board using a common household iron. The plastic is formulated to withstand temperatures up to 320F and therefore poses no danger of melting in the photocopier or under the iron. Instructions on using the film are very clear and cover photocopying, transferring, and etching.

I have produced several p.c.boards with the Tec-200 film from magazine articles and 2:1 originals and note the following:

1. The artwork has to be reversed (mirror image). Most magazine articles give you a 'right-sided' circuit pattern so it is necessary to make an intermediate transparency with the TEC-200 film. Flip the intermediate over and make your final copy. The temporary copy can then be stripped with a solvent and reused.
2. The iron temperature is important. Too low a temp. and the image will not transfer, Too high a temperature and the line work smears. Too much pressure on the transfer will have the same effect.
3. If the transfer is not complete after you have removed the film, use a fine tipped permanent marker to touch up the prepared board.
4. Etch the board as quickly as you can. For small boards, a 'Fridge-o-seal' container works very well. Place the prepared board in the container copper side up, add etchant to cover, close the lid and agitate the container in a hot water bath. With this method the etching time can be reduced by almost 50%.

With a program like P.C. DRAW for the 2068 or ZXPAINTE for the TS1000, TEC-200 gives you an easy way to make your own printed circuit boards.

# STOP THE PRESS SOFTWARE REVIEW LARKEN SEQUENTIAL/RANDOM FILES UTILITY

Larry Kenny (Larken Electronics Navan Ontario) has recently provided a new software offering based on the concept of sequential filing previously included in the version 3 LKDOS EPROM. This utility is available on disk and provides users of earlier LKDOS EPROMs with the opportunity to get into the world of random/sequential filing; even for version 3 holders, it provides added capabilities for using this ram-resident extension to the LKDOS system.

The utility allows the LKDOS-2068 to handle large data base files and exploits features of the 2068 hitherto unused. Up to four files may be accessed simultaneously to permit data to be sorted, merged, etc.

Included with the disk is a very thorough seven-page document of explanations and instructions. It is well organized and relatively simple to follow; but it took me several readings along with trying the example file to begin to absorb the complexities of the system and there are still parts that will require much more study and application.

The disk contains the main BASIC program <SRcode.B1> which will in turn load in the operating code <LBASE.BC> as a long REM statement (about 2500 bytes). When the program is RUN, the BASIC memory map is initialized and the BASIC "start of program pointer" (system variable 23635/6) is changed to an address well past the end of the REM statement to make it invisible in the listing and safe from everything except the NEW command.

In the version 3 EPROM, the sequential filing system has two modes: OUT and IN. In the disk version data is handled in two modes: Output (OUT) and Random Access (RND). OUT is used to create a file or to add more data to an existing file.

RND is used to print or get data from existing files; data can be read sequentially from start to end of the file OR can be randomly accessed from anywhere in the file and then read or changed; the latter is accomplished

using a new TAB command and it is this feature that is not available in the EPROM. This opens up all sorts of possibilities for handling large amounts of data (up to 800K on a quad disk drive).

The documentation gives examples to show how all this done and this exercises the grey matter slightly more than somewhat. To make it a bit easier to follow, a sample data base is included on the disk: <TIMEDESGN> which is a contents list of Time Designs Magazine articles. The file <LBASE.B1> should be examined carefully to determine how the random filing system works and along with the documentation, things begin to get clearer. It is best to make a copy of the listing for closer study. But take care: If after <TIMEDESGN> has been opened, you wish to study the BASIC or to make some changes, you must first close the file. If you forget to do this and BREAK into BASIC, you will have to use <RAND USR 26800: CLOSE# 7> and then GO TO 1 to set things right again.

Searching for any given string is a feature of the disk version of Sequential/Random Filing; it is very versatile and recognizes any input in either upper or lower case, eg, entering a string <LARKEN> would also turn up records with <larken> or <Larken> or even <LaRkEn>.

The LBASE sample that is included on the disk is not complete as a text editor; neither is it a word processor; rather it is an example of what can be done with the Sequential/Random (S/R) Filing system. The instructions make this point in a section entitled <Adding new features to LBASE>. For example, a sort routine might be added either in machine code or as a compiled BASIC add-on. I found it easy to add a routine to print any given record to either the 2040 or wide printer. Some hints are given on how to accomplish this but this will call for some ingenuity on the part of Larken users.

This review has touched on only a small part of the detail contained in the Larken documentation. It is a utility for the serious programmer and is recommended for those who want to extend the use of the 2068 to very large data bases. Much work would have to be done to merge the S/R filing concept with other features found in data base programs such as Profile.

# LKDOS SOFTWARE

## MAXCOM 300/1200 baud Terminal/BBS

This full feature modem software lets you effectively link the modem to the disk, so you can upload or download files larger than 100K. This lets you send NMI saves and large text files as well as Basic or Code files, which other modem programs couldn't send because of memory limitations. Also files can be sent with or without a information header (Spec-term compatible) .

It also has a 64 column display and is the only 2068 modem program that will run at full 1200 baud without missing characters. Other features of the terminal mode are IBM graphic characters, auto-dialer, macro keys, 110K disk buffer for captured text, auto repeat keys.

The BBS is the most elaborate available for the 2068 and allows the remote user full access to the disk drives similar to a CPM BBS. Features of the BBS are - 300/1200 baud, operation with fast reponce even at 1200 baud, Passwords, priority levels, Use time limits, Multiple Message Bases, Uploads and Downloads are not limited by Memory, Dual Window Monitor screen, Interrupt driven time out and Hangup protection. Also Keeps a User log of callers Names and Activity on disk so a printer isnt needed and its easily customised and expanded.

MAXCOM can be used with the 2050 modem or with the Z-SIO RS232 interface and a 300/1200 baud modem. (a version for the Aerco RS232 is in the works).

PRICE: \$24.95

## LARKEN DISK EDITOR

This program lets you examine or change any byte on a LKdos disk. It is useful in repairing damaged or glitched disks, changing the disk Name or head speed etc. You can also examine the track map and disk info headers.

The documentation for the disk editor also includes information on how to access LKdos from Machine Code and information on the structure of the disk catalog and data blocks.

PRICE: \$15.00

## SEQUENTIAL/RANDOM Access FILES

This utility is a ram resident extension to the LKdos operating system and lets you create, read from, or write to very large data files kept on disk. It uses the commands OPEN#, CLOSE#, PRINT#, INPUT#, and INKEYS# to access the files from BASIC. There is also a high speed search command for finding a text string within the data file. Using the TAB command, you can randomly access directly any record in a file.

The utility is easily used within your basic programs and has a lot of uses, from storing large data files, creating large spell checker dictionarys or even converting you basic programs to an ascii text file .

This utility lets you take the limits off of the data capacity of the 2068 .Files on disk can be huge !

A simple data base program is included on the disk to demonstrate the utility.

PRICE: \$ 15.00

## Coming Soon from Larken Electronics

•• The Larken Desk Top Publisher •• Produce high quality printing (like this page ) with an Epson compatible printer and LKdos. The entire Hi-res graphic page is kept on the disk and scrolling though the page is as easy as clicking the joystick or mouse on the Icon type menu. Text and Graphic editing with multiple sized fonts will also be featured.

•• Spell Checker for Tasword and M-Script •• This utility program will let you have your wordprocessor text files be checked by a 350K dictionary.

All Prices \$US - Specify type of drive when ordering.

(613)-835-2680

Well the great day/weekend has come and gone. All that remains is memories. And what memories. Was the show a success? Well, we don't know what the show sponsors and dealers thought, but the consensus of the 6 members from our club who attended was that it was a trip very worthwhile.

Rene Bruneau, Renato Zannese, Lou Champagne, Hugh Howie, and myself went down to Washington D.C. in a rented van. Jeff Taylor also attended; he went down by car with his family.

The van left at six o'clock on Friday evening, with Rene driving. Picking up Renato and myself at the Toronto Kipling subway station, we then collected Lou Champagne in Oakville, and Hugh Howie in Burlington. We travelled via Buffalo, Erie, and Pittsburg, to the outskirts of Washington, arriving there at about 6.30 am on Saturday morning. Driving was not good. Rain, fog, and road repairs were the order of the night.

Had breakfast at a nearby restaurant, and then waited for the show to open at 9 am.

A small crowd was waiting to enter the hall where the computer show was to be held. When the doors opened we streamed in. Paid our \$10 2-day admission fee and got a name tag.

The hall was ringed with dealers tables. To the right as we entered was ZEBRA SYSTEMS with several tables. They were offering a multitude of books on Timex computers, loads and loads of software for the TS1000; also I saw some Alphacom 32 printers, some defective TS2068's (I bought 2 at \$15 each!), lots of bits and pieces relating to the TS1000. 16K RAMpacks in abundance, some TS2050 modems. I saw a Timex Portugal Disk system for the TS2068 being offered for \$200.

At the next table was Time Designs magazine Company. Tim Woods was there explaining why he was late with the Time Designs issues. More about that in a separate article elsewhere in this issue.

Tim was offering a number of Timex books, compendiums of early issues of the Time Designs magazines, and subscriptions to the

288 magazine, PIPELINE. Also he was offering the Sinclair 288 computer for \$400 (if my memory serves me correct).

The next table was held by Jack Dohany. He had a Larken system running and was demonstrating several of his programs; also he was preparing disks to order, of these programs.

Wood and Wind computing was represented, offering business software for the QL. They had a system up, complete with monitor and printer, to demonstrate their software.

Then there was Peter Hale, demonstrating an administrative program. Am I correct in thinking it was SMARTEXT? Anyway, there were about eight persons paying close attention.

John Tasmino(?) was there selling a mixture of ZX81 RAMpacks, and some QL microdrives and chips.

Mike Fink was ensconced under the banner of Domino Cubes. He was touting the merits of the 288 computer, and the advantages of purchasing one from him.

The CATS club had a booth where they were selling Fest souvenirs, such as hats, T-shirts, issues of their newsletter, etc.

Johnson Computers was offering reconditioned TS2068's for \$62, also 2068 SCLD chips for \$25, some TS1500's, and several disk drives. They were using a Larken combination to demonstrate their software.

Quantum Levels were offering subscriptions to their magazine in one corner, while nearby Tom Bent had a number of items on his table, mostly relating to the QL.

One of the most popular tables seemed to be that manned by Skip Fisher. Skip was selling reconditioned RGB monitors for \$65 to \$100. I think he was sold out by the end of the first day, all thirty monitors!

A+ Computer Response was present. They were selling QL computers, on an as is basis. They also seemed to have some ZX81 stuff on sale.

In the centre of the hall was a set of counters manned by Sharp's. They had lots of new QL's for sale at \$90, plus a lot of software and peripherals for the QL. They also had a C5 vehicle. This was Clive Sinclair's ill-fated venture into battery-powered personal transportation.

Aside from the host CATS group, several other clubs had tables at the fest. There was the Sinclair Milwaukee Club with a demo of the Digitizer they describe in their newsletter, and which they are selling.

The Greater Cleveland T/S Users Group were there with a camera/TV scanning the crowd.

Also the Sincus TS group had a couple of monitors on their table, being driven by a Larken/Oliger system. They were offering copies of Sincus News, and other items.

At one point I counted the number of persons on the floor. It seemed to me that there were about 100 persons attending and about another 20 persons manning the counters. In addition there were an unknown number attending one of the seminars in progress at the time.

There were seminars in an adjoining conference room. They covered topics such as "Office use of the ZX81", "Making the most of your QL", "Applying the 288", "The TS2068 and More BBS about Modems", and other subjects.

I attended one seminar, a talk by Nigel Searle. It had an attendance of 50 persons. There were empty seats; I would say just a bit disappointing, the attendance, that is.

Did we buy anything. Did we! Why, we now have four new QL users in the group. To say nothing of several TS2068's, an RGB monitor, some QL programs, and various books, and bits and pieces of hardware.

All in all, a very satisfying experience. Our hats are off to the CATS group for their handling of the event, and for making it possible for so many Timex members to meet each other, and to become personally acquainted with the various Timex dealers. Thanks again to the CATS group.

\*\*\*\*\*

## PLAYING WITH SOUND

As all you QLers know, the sound on the QL is kind of limited. The BEEP command does not seem to have any set order to it. By order, I mean that you cannot get, for example, a C# note unless you tirelessly experiment with a trial and error method. Unless some new developments come up in the sound department, that's what we're all stuck with.

To make the job a little easier, I found this program in QL SuperBASIC, THE DEFINITIVE HANDBOOK by Jan Jones. She was the designer and writer of Sinclair QL SuperBASIC along with help from Tony Tebby (a familiar name in the QL league). It's a beep exerciser. Yup. Just type it in and call it by typing 'beep\_menu', you'll see what I mean.

About the program: It is generally a menu driven way to experiment with sound interactively. I modified it so that a joystick may be used to control the selection process.

Excerpted from members letters:

A response to a letter/article that was in the Mar/April '89 newsletter.

\*\*\*\*\*

Dear George and Company,

Let me begin with a response to the letter by John Vander Stel, which others may be interested in.

A simple way to get a non-flashing prompt in the lower part of the screen is to use a PRINT #1. After a response is found, then an INPUT "" will erase the prompt, so the lower part of the screen can be used again. This has the same problem as does the method John uses if the prompt is over a line long, that it will scroll the screen if it was full. If the prompt is only 2 lines long, this could be avoided by making it PRINT #1; AT 0,0; which will lose the line separating it from the rest of the screen, but this could be okay if the main screen and border are not the same colour (not an option on OS-64, but perhaps INVERSE 1 will work as well for this). Try the following lines:

```
10 PRINT #1;"Edit   Next page   Prior page"
20 PAUSE 0: LET IS=INKEY$: INPUT ""
```

An example I have used often is the following as a subroutine:

```
1000 PRINT #1;"Press any key to continue.":
PAUSE 0: INPUT "": RETURN
```

Note also, if you are using INVERSE 1, and want to fill the whole line, (or if you are not using the standard BORDER colour) an easy way to do that is to end your PRINT with a TAB 0; or an appropriate number of commas. Since the prompt is not erased until after a key is pressed, we can even use the PAUSE 0 method John suggested, as was demonstrated in the listings. An example using everything mentioned is:

```
1000 PRINT #1;AT 0,0; INVERSE 1;"PRESS Z to
COPY to printer,","any other key to
continue.",; PAUSE 0: LET IS=INKEY$: INPUT ""
1001 IF IS="Z" OR IS="z" THEN COPY
1002 RETURN
```

#### LARKEN RAMDISK (Bug Alert)

One of our members, Earl Dunnington, has provided us with a tip with regard to the Larken RAMdisk. He writes:

"Some Larken RAMDISK memory boards may have a glass diode reversed. The symptoms are that the batteries may wear out in a very short time, causing CRC errors for all of the blocks when using RANDOMIZE USR 100: VERIFY"". The diode upper left component side of the board when attached to the computer. There should be no voltage on the left side of the diode when the computer is off and the batteries have been installed.

The fix is to snip the leads about half way, turn the diode around and solder it back to the stubs of the leads. Be sure the BATTERIES ARE REMOVED AND THE COMPUTER POWER IS OFF before attempting repairs."

G.F.C.

Larken Tip  
by G. Chambers

You may have an occasion when a disk catalogue call (CAT "",) comes up with a CRC error. Nothing special about that. However, sometimes you may be puzzled by a CAT listing which sometimes appears along with the CRC error.

What has happened is this:

The printout you see is that of a disk that was CATalogued immediately prior to this. The Larken system is simply printing out what is being held in the DOS RAM from an earlier CAT function, and which has not yet been erased.

As an aside, I should mention that if you get a CRC error when doing a CAT, it means that your directory has become corrupted. Not to worry; simply use the Larken utility "repair.B1" to recover it.

MODEMS MODEMS MODEMS  
by G. Chambers

In the Nov/Dec '88 issue of the newsletter I mentioned that the CNIB (Canadian Institute for the Blind) were offering Rixon 212A data sets for \$42 each (plus shipping). Several members have bought them and are using them. I understand that they are still available.

I have since had a letter from this group which could be of interest to some of our members. To quote :

"Your group may be interested in the fact that within the past week, Bell has decided to make Smart Modems available to us. These have auto-dial and another bunch of good features and are fully Hayes compatible. The price is \$67.50 plus postage and they can be ordered directly from me at this address. The model number is 212A/ED+, made by GDC"

If you are interested, or have questions, why not drop Mr Taylor a line.

==>BOB'S NOTEBOOK<==  
JUMPING BACKWARDS RELATIVELY SPEAKING

The Z80 machine language instruction JR e means Jump Relative by e addresses. JR cc,e does the same thing but only if condition cc is met; cc may be any one of: NZ, NC, Z or C.

The relative jump may be forward or backward and in the latter case, the convention used is that any value greater than 7F hex (or 127 dec) will be taken to be a negative offset, ie, the normal decimal value of the hex code minus 256.

For example, the offset value -10 is F6 (246-256). An instruction JR F6 would cause the routine to jump backwards by ten addresses. Counting starts with the next address after the JR F6 line, deemed to be the zero datum point, be it forward or backward.

Normally an assembler will do all this for you automatically as you put in your mnemonics and labels but later you might want to study the disassembly and follow the jumps etc in any debugging process.

Here is a short program to generate a table of backward jumps with hex numbers from 80 to FF (-128 to -1 dec). Type in the program lines carefully watching the spacing in line 140 and the length of L\$ in particular.

LISTING 1

```
100 PRINT
110 LET L$="=====
=====":REM 81 ='s
120 PRINT TAB 9;"NEGATIVE SIGN CONVENTION FOR
BACKWARD JUMPS (JR)"
130 PRINT L$
140 PRINT "  0   1   2   3   4   5   6   7
  8   9   A   B   C   D   E   F":REM 4 spaces
between characters
150 PRINT L$
160 LET v$="89ABCDEF"
170 LET a=1
180 FOR i=128 TO 1 STEP -16
190 DIM n$(3)
200 PRINT v$(a);
210 FOR j=0 TO 15
220 LET n$=STR$(i-j)
230 PRINT " -";n$;
240 NEXT j
250 LET a=a+1
260 PRINT
270 NEXT i
280 PRINT L$
290 RANDOMIZE USR 100: CLOSE #2
300 STOP
310 RANDOMIZE USR 100: SAVE "jrnegC.B1" LINE 320:
STOP
320 RANDOMIZE USR 100: OPEN #2,"1p": RANDOMIZE
USR 100: POKE 16
094,8: RANDOMIZE USR 100: POKE 16090,81
330 OUT 127,15
340 GO TO 100
```

This program is designed to run with a dot-matrix printer in the condensed mode. It will also run in the Elite mode if you make the following changes:

```
330 GO SUB 350: OUT 127,27: GO SUB 350: OUT 127,77
340 GO TO 100
350 IF IN 127<>237 THEN GO TO 350
360 RETURN
```

Bob Mitchell 890408

TIME DESIGNS Magazine  
G. Chambers

For some time the burning question has been 'Where is it'. It was with this in mind that when I saw the TDM booth at ComputerFest, I proceeded directly there to question Tim Woods about the non-appearance of the magazine since the July/Aug '88 issue.

To my surprise I saw copies of the two missing issues there. In fact, I was able to pick up not only the two issues due on my subscription, but I was able to carry off the same two issues for three other Toronto members who have not seen their subscriptions either. This, of course, put me into a more receptive mood for explanations.

Tim was very forthcoming in his explanations, and I found myself with some sympathy for his predicament. As we have read, he has had a new son, and also had to cope with the death of his father. Seems that winding up his father's business took an inordinate amount of time, and the TDM affairs simply went by the boards. Well, I gather he did ask his wife to get out the mailing but she, being more clever than he ever imagined, wriggled off the hook by messing things up even more!!

Have I put my foot in it for you, Tim? With your wife, I mean!

Anyway, all you long-suffering subscribers out there, the word is hang in, the issues are coming. I have been looking at my copies and they are pretty good. Tim says that TDM is still strong, healthy, and a going concern.

To any TTSUC members I suggest that if you are missing issues, drop me a line, and I'll see what I can do. If you write to Tim Woods your letter will probably become part of the enormous pile of mail that has accumulated at the Woods' place and won't be answered for who knows how long!

LARKEN - DISK DRIVE  
INFORMATION  
BY G. CHAMBERS

*drives, CT*

One of our club members has provided us with an excerpt from a service manual dealing with disk drives used on the IBM computer. Many Larken owners have drives which were originally designed to work with the IBM computer. The information would be of interest to these owners.

The manual states that "... There are two basic drives types used in the PC. Many of the steps for diagnostics and repair are the same it is called Type 1.

"A type 2 drive is made by Control Data Corporation (often called a CDC drive). It's serial number begins with the letter D.

The copy I have comprises 18 pages, and simple test procedures, using a meter, to check drive operation. There are a number of photographs, but these are rather unclear, due to the photocopying process. The text should be adequate, however.

Interested members should drop me a line. I can send you a copy for the cost of copying and postage, \$2

LARKEN-DISK LIBRARY  
BY G. CHAMBERS

In the last two newsletters I have described the initial two disks on the club library. This time I shall mention what has been added to the disk library.

Disk #4..ASTRONOMY

For this disk I have combed our tape library and assembled a variety of programs pertaining to astronomy. Some are trivial, others are pretty good. This disk is full, so that if any more programs come to light it will mean doing some culling or else starting a new disk. This disk is a DS 40 track size.

Disk #5..MUSIC and SOUND

Similar to disk #4, I have assembled all the programs I could find in our tape library pertaining to music. Some of the files give musical tunes, others provide the tools for creating sound on the TS2068. This disk is a DS 40 track type. There is room on it for a few more programs.

DISK #6..ADVENTURE PROGRAMS

The programs on this disk have been assembled by one of our out-of-town club members, Les Cottrell. The disk contains quite a variety of text and graphics adventure programs suitable for use on the TS2068, i.e. you don't need a Spectrum Rom. Again, this disk is DS 40 track.

Others in the works..Financial Sounds, Graphics, etc. Any ideas, anyone interested in creating a disk for our disk library?

\*\*\*\*\*

The QL has great string manipulation functions that offer a great deal of flexibility. The method of coercion should eliminate the need for the VAL function, however, there are times when you MUST have it.

For example, I was working on a program that would plot any mathematical function on the screen. The function had to be a two variable function ( $y=\sin(x)$ ,  $y=x^2$ , etc.). The plotting part of the program was easy to write, but the function had to be embedded in the SuperBASIC lines because it could not be put in a string and then evaluated. A friend of mine had the same sort of problem, so we set out trying to find a solution.

On the 2068, the following would be solution:

```
100 INPUT "y = ";a$
110 INPUT "x goes from? ";x1
120 INPUT "x goes to? ";x2
130 FOR x=x1 TO x2
140 LET y=VAL a$
160 REM you now have x and y co-ords
170 REM do scaling and plotting
180 NEXT x
190 STOP
```

After hours of thought, we both came to the same conclusion. We have to make full use of the ability to work with channels on the QL. Since we both have the MIRACLE SYSTEMS TRUMP CARD, references to 'ram1\_' are used, but these can be changed to any device name. The following program skeleton can achieve the same results as above (in a round-about way).

```
100 DEFine FuNction y(x)
110 z=COS(x)
120 RETURN z
130 END DEFine
140 INPUT "y = ";a$
150 INPUT "x goes from? ";x1
160 INPUT "x goes to? ";x2
170 OPEN_OVER #3, ram1_temp
180 PRINT #3, "110 z=";a$
190 CLOSE #3
200 MERGE ram1_temp
210 FOR x=x1 TO x2
220 y=y(x)
230 REMark you now have x and y co-ords
240 REMark do scaling & plotting
250 END FOR x
```

Here is a brief explanation. First of all, -TK2\_EXT calls up the Toolkit II extensions. They really aren't necessary, but make things fast and simple. If you don't have the toolkit or added RAM, then change OPEN\_OVER in line 130 to OPEN\_NEW. OPEN\_OVER just OVERwrites the file if it already exists. Also, change ram1\_ to any valid device which you happen to have.

Line 110 just sets up a dummy equation to avoid a null assignment. Since the QL does not have the VAL function, a problem arises when you say

```
a$= "x^2+4*SIN(x)-LN(x)"
x = 2
y = ??
```

How are you going to evaluate 'y' with the value of 'x'? You want to sub the value of x into the equation, then assign that result to y. The way in which the program does it is simple when you look closely. It just changes the line that has the equation in it by merging a one line program. This one line program contains the equation that was input by the user. With RAM disks it behaves like a built in function, but with microdrives it is sure to be a pain.

If you are going to use this routine, be sure to make the appropriate changes to the line that stores the equation in the new program (line 180 in the listing). Also, don't be confused with the DEF FN. It uses x as a parameter, but it is not the same as the x later on in the program.

Any questions or suggestions? Call or write to me.

# LARKEN 2068/SPECTRUM PRODUCTS

## LKDOS -EXTENDED BASIC Cartridge

This multi function software cartridge is fully Spectrum compatible and can be used with ALL software for 2068 or spectrum. The cartridge contains the DOS (disk operating system) and is used to control the Larken DSK-400 or other Disk Interfaces. The LKdos cartridge uses none of your program ram as it has its own 8K ram and 8K rom on the cartridge. It is also compatible with OS-64 and other cartridge based Roms.

All commands, LKDOS or Extended Basic use standard keyboard commands preceded by PRINT #4: eg; PRINT #4:LOAD "filename" CODE

It will support 1 to 4 floppy diskdrives as well as a 256K Nonvolatile RamDisk. The dos automatically keeps a catalog of all files on disk and takes care of all file space allocation etc. (No need to worry about lengthening existing programs which you cant do with some 2068 Dos's)

Basic, Code and Array files are saved the same way as cassette. Sequential Files are also supported. Now you can OPEN a file and PRINT to it the same way you would print to the screen or read information from it with INPUT# or INKEYS#. This is very useful for working with text files.

Commands for LKDOS are LOAD, SAVE, CODE, ARRAY, SCREEN\$, MERGE, LINE, CAT, FORMAT, ERASE, VERIFY, PRINT, GOTO, OPEN, CLOSE, MOVE.

Also any program can be transferred to disk with the push of a button (Using NMI save push button on disk interface).

As well as LKdos commands, the cartridge has a number of Extended Basic commands. Eg; PRINT #4: CIRCLE x,y,(pattern) -is now a graphic Fill command with 10 different patterns.

Other commands include ; multiple windows, Box clear and fill Channel opening for Disk, Printer and screen, variations of Poke, Paper, ink and Clear.

The command PRINT #4:OPEN #3,"LP" lets you use a Large Printer with Lprint or Llist commands. It can be used with AERCO, TASMAN or A&J printer interfaces and it supports Line length, Margin, Tab, Comma and other parameters.

-This cartridge is also available for the AERCO RAMEX and OLIGER disk systems. When the cartridge is installed, they will emulate a Larken Disk system. Demo disk supplied.

## 400K 2068/Spectrum Disk Interface (DSK-400)

This disk interface combined with the LKdos cartridge will give you a 2068/Spectrum disk system second to none. This double density disk interface will put 400K on a double sided 40 track drive. It can control up to 4 - 3", 3.5" or 5.25" single sided, double sided or quad density drives (800K on a Quad). This board is a compact low profile design that connects to the rear buss on the 2068 and has a thru connector. It can load 32K in less than 5 seconds. The NMI (snap shot) pushbutton is on the board and there is also a KEMPSTON compatible joystick port which is the standard for all spectrum software.

## 256K Nonvolatile Ramdisk Kit

The ramdisk now supplied as a kit which consists of a PC board, main connector and instructions. The other parts are easily obtainable from electronic suppliers. This kit is recommended for experts only. (The ramdisk cant be used with the Aerco FD-68).

This rear mounted memory board also uses the LKdos cartridge for its operating system. The PRINT #4:GOTO (device) command is used to direct the Dos to Floppy disk or Ram disk. All LKDOS floppy disk commands are treated the same for ramdisk. It can be used with the Floppy disk I-F or without.

It uses the new 32K byte static ram chips (62256-1p) More chips can be added for up to 256k. Two 'AAA' batterys provide battery backup for data retention.

Special circuitry protects the ramdisk from any data loss even if is removed from the 2068. Very Fast and Reliable.

PRICES ---	LKDOS EXTENDED BASIC cartridge	\$65.00
(all prices)	400K System (Cartridge + 400K Interface)	\$119.95
(are \$US)	Ramdisk PCB and instructions	\$20.00
	Disk ribbon Cable (1 drv)	\$8.00
Add \$5 S&H	(Call for info on Disk Drives and complete systems)

TORONTO TIMEX-SINCLAIR USERS CLUB

April 3, 1989

Les Cottrell  
108 River Heights Drive  
Cocoa, FL 32922

14 Richome Court  
Scarborough, Ont.  
M1K 2Y1

Dear Les,

Sorry I have not got back to you before now, regarding a couple of disks that you have sent me. I have only just now taken a close look at them.

What I see is that the first one that you sent was a bit of a mixed bag. Then, it looks as though you took heed of my comments about what I thought a club Larken library should look like, And sent me a second disk that incorporated many of those ideas.

I worked over the ADVENTURE disk a bit, adding a number of similar programs that I had, to fill up the disk. I also modified the disk header label, and added to the description file. You might look at the appearance of the description file on the screen. I used a different font in it. A font that I think makes for easier reading. The font is built in to the taswid code. This modified code is labelled "taswid.Cx". I have also used the ON ERROR GOTO routine as well. You might take a look at how it works. If you answer the scroll? message with a "n" the ON ERR routine gets you back to the menu promptly.

I have placed this modified disk into the library as Disk #6. If you have any ideas on revising it, please do so. I would like to think that this was your disk contribution to the library, and under your control. The mods I did are to be considered suggestions only.

I see where the other "SHARE DISK" that you sent me has many programs on it which are also on the other disk, so I am in a bit of a quandary as to what to do with it. The SPECWORD program is very interesting. I'm not sure that I prefer it over Tasword, which I am using, but it is an interesting program. I started to modify the SPECWORD to use the version 3 Larken printer driver routine. But I now think that was a wasted exercise, since probably the graphics control codes will work only with the modified AERCO software.

I tried the Larken version 3 printer routine on TASWORD some time ago, but found that the graphics printer codes needed the Tasword printer software in order to be effective.

The interesting thing about the instruction files "one.CC", "two.CC", etc., is that they are in 32 column format, not, say, 64 or 80 columns. I printed and pasted them up as such, but I would have liked to be able to make the program print them out in 64 column mode. I was unable to do this.

Sincerely,

George Chambers

March/April 1989

March 4, 1989

Dear OUT-Of-town Members

I see where it's that time again!. We have a rather large newsletter this issue. Please don't come to expect that every issue will be like this. Of course we would like it to be so, but that depends on the material that we get from our members. While a lot of the material comes from regular contributors, it has been observed that our newsletter gets contributions from more members than many other newsletters. This is a nice thing. We would like to have each one of you consider a contribution. Please!! Would "Pretty Please" do it!!

Would some of you also drop a line to the Editor and tell him what you think of his efforts with the newsletter. Personally, I don't think I've seen greater effort put into it or a nicer publication since it was first brought out in 1983.

Before I forget it, a query. Am I up-to-date in my answers to member requests. I think I am, but I have a nagging feeling that I owe a couple of disks to some one. I have a few letters to answer, which I will do up with the newsletter. But if anyone is waiting for something from me, do let me know. (I say this in every newsletter!)

I see that in my last missive I mentioned that I had received some 32K SRAM chips for my RAMdisk, and that they were not functioning properly. Well, I phoned JDR Microdevices, in California. They do not have a toll-free number i.e. 800, from CANADA, as they advertise. So, I called after 6pm, which made it about 3pm in California. A woman answered, and said "please hold on". I said, "Wait, this is a LD call from CANADA! Don't take too long". Well, to make a story short, she did come back promptly, listened to my tale of woe, gave me an order number, and told me to send them back, they would replace them. Sure enough, in about three weeks a new set came, and they seem to be working perfectly.

The defective chips had a CSI logo; the replacements an NEC logo (the same as the original 2 chips on my system). So I have my disk menu program on the RAMdisk, plus three menu SCREEN\$, TASWORD, doctor.B1, and a couple of Larken utilities. There is still a bit of space left, that I am reserving for the next idea I may have.

Anyway, I have to say that I was happy with the way JDR Microdevices handled things, and I would have to recommend them to anyone who wants to purchase chips.

My remote keyboard project has been placed on the back burner for the moment. I have been doing a bit of work with a modem. A local group was offering 300/1200 baud modems for \$42. Three of our members have bought them, and we have been busy getting them up and going. Well, it meant ordering a Z-SI/O (serial port) board from ED Grey, and wiring it up. This is required to interface the modem to the TS2068. I have my modem connecting to another modem OK, but so far I have not been able to communicate. Another member, Renato Zannese, is trouble-shooting it for me at the moment. Whether there is a real problem with the I/O board or whether it is my own incompetence, I'm not sure!! I'll keep you posted.

The modems are a good value. They are a surplus item from the local telephone company, donated to the CNIB Amateur Radio Group as a goodwill exercise, for them to raise money. They come with a 5 year guarantee. It seems to me that the telco is retiring them from service, and doing a good turn at the same time. I am told that they are working with IBM clones, and with Commodore computers. I expect them to work with ours, also. They are built like a tank (and weigh almost as much). Anyone interested? I think they are still available.

I'll tell you a little story. I was in the local electronic surplus store, and there, on the floor, was a whole heap of them for \$10 each!! Well, I explained this to the other two who had bought the \$42 variety, however there was a feeling that they were still a good buy. Whew! I'm relieved!

The \$145 RGB monitores have been a success. I saw one of them in action, and I hate to admit it but it seems to be a better image than the one on my Sears RGB!! It was hooked to a QL, and it gave a dazzling performance of coloured graphics. I guess the QL is faster than the TS2068 in getting things on screen. Fortunately for me, they had sold out when I went next time, so I did not have to decide not to buy one, the decision was made for me!

We had a bit of trouble getting the interfacing cable right. A visit to Schennelly Stoughton got us on the right track. Well, what I really mean to say is that Schennelly got them working pronto!! If you remember, I mentioned Schennelly and computer repairs, in my last missive.

As you will read in the newsletter, Hugh Howie is now looking after the QL section of the club. So I rather expect that there will be some great activity in that department. Maybe it's not moribund; maybe dormant would have been a better term!! OK, OK Hugh, I won't say any more, except "great stuff".

The TS UPDATE magazine made mention of our newsletter being strong on Larken, as a consequence we have had quite a number of requests for a copy of the club newsletter. Also a number of new members with the Larken system have joined. There has also been quite a response to the Larken library. Have I ever been busy, recently. Tell me about it.

We do welcome the new members, and hope that you take advantage of all that our club offers.

One of our new members, along with his membership money, sent us a copy of a QL service manual, and a QL technical manual. Another member sent an article for the newsletter (on a QL topic) along with his application form. That's the kind of new members to recruit! Thanks, Senen Racki and Mike Ferris.

Yes, and Senen has also sent me a xerox copy of the QL schematic. It'll need a bit of work to make it useful (legible) but will be a useful addition to our club resources.

There have been quite a few new members join since I last gave a thumbnail sketch about myself. maybe it's about time to do it again. This way, you out-of-town members will have an idea who you are corresponding with. I like to know who I'm writing to, but I can't put this sort of info into every letter I write.

I have been retired since 1981 from the Bell Telco. I worked there as an engineering

3/29/89

mine  
11 22 have  
NEC logo

assistant. Married, with 3 adult children, none of whom are interested in computers! Have dabbled over the years with housebuilding, photography, Pottery (throwing and firing), gardening, and lastly T/S computers and computer clubs. Been a Scout Cubmaster for some 18 years.

I mentioned Bill Harmer as having a document on Larken and the ZX81. He has sent me another draft of the document; this time a greatly expanded version. If any one would care to critique it for Bill, I would be happy to send you a copy.

We have an index of exchange club newsletters in our club library. I can send you a copy of it if you wish. We are assembling the newsletters by club. We therefore have files for about 15 clubs. If you are interested we would be delighted to send a file out to you. We would like it back of course, and you would be expected to cover our postage costs. Other than that, there is no hooks to the offer! Let's make use of them. Some club's newsletters are better than others, of course.

Recently we have started exchanging with four new Timex Sinclair groups.

They are: The Cedar Rapids and Greater Iowa Sinclair Timex people, the Seattle Area Timex/Sinclair User Group, the Vashon Island Timex/Sinclair Association and the Boston Computer Society (Sinclair/Timex Section).

I'm not sure whether I mentioned it before, but I have been assembling various musical/sound program onto a Larken disk to include in the club Larken library. I would like to fill up a Double sided disk. I have about 20 programs so far. Maybe some of you have a contribution I can put in it. I have two of Joan Kealy's programs, Perfidia and Evergreen. Joan has written several others and I would like to include them on the disk. Any help?

Any other ideas for topic disks in our Larken library? A graphics disk? One on Astronomy? Printers?

Now maybe we can see what our exchange newsletter have to offer us:

The Vancouver T/S club newsletter, ZXAPPEAL, reports that they have received the Sept/Oct Issue of TIME DESIGNS. Has anyone else received it. I hear TIME DESIGNS have a recorded announcement on their telephone line that says everything is up to date; that the newsletter is on it's way. (Not clear which issue they are talking about) I sure wish there was a little bit more integrity about some of these publishers. I'm really getting fed up to the teeth with all this shilly-shallying!! I have received nary a word since I sent in my renewal back in July '88. I know Bill Jones says, "have some sympathy for newsletter publishers", but enough is enough, surely.

The Feb (89 issue of ZXAPPEAL has an article entitled "The ZX/TS True 64K Internal NVM Upgrade". The copy is from a ZX Printer, but if you would like a copy, ask me. This issue also has an article on QL overheating, and how to solve it once and for all. I see where it is a reprint from the QL newsletter, QUANTA.

The Jan '89 ZXAPPEAL has a good article on how to protect your computer from transient power line voltages.

The Harrisburg T/S newsletter (Jan '89) has an article on making up a Z88 to IBM or TS2068 interface cable, showing pin connections. The Feb '89 issue has a full-page advert (sort of), for a software package which is purported to make your QL think it is an IBM PC. There are two versions of it, one called the Vanilla Solution, the other more elaborate version the Chocolate Solution. RMG Enterprises appear to be promoting it. Some cost figures are given, (80 Pounds/Vanilla and 130 Pounds/Chocolate), but just what that translates into RMG figures is not clear. I can supply a copy of this information, if you are interested. Or you could drop a line to RMG Enterprises. I suggest sending a US dollar bill to them, for stamps, etc.

The newsletter TIMELINEZ (Dec '88 issue) has a lengthy article on the John McMichael interface board. This allows hooking a Commodore 1520 four-colour printer-plotter to the TS2068. The newsletter has an original example of the plotter output pasted up on the front page. Very novel.

We have started a newsletter exchange with a T/S group in Cedar Rapids Iowa. The first issue we received has a lengthy article on a battery backup for the TS1000, using a 12V, 2.5 AH gel cell.

SINCUS NEWS (Jan/Feb '89) has a three-part series called "Exploring the TIMEX/SINCLAIR 1000's Sinclair Logic Chip"

The CATS n/1 (Jan '89) has a couple of QL articles. One is a lengthy article (which looks impressive) called "LET'S IMPORT". This newsletter also has an article on how to eliminate retrace lines from and RGB monitor when used with a 2068 or QL.

The SMUG newsletter (Jan '89) has an article of interest to Aerco Disk Drive owners. It is a tutorial on a disk utility called SEKTOR. The same issue of SMUG Bytes has an article on a Digitizer for the TS2068. It says their club will sell assembled, tested digitizer boards for \$50 US, plus \$3 shipping and handling. A feed through connector will cost another \$5. There are a couple of cautions. It won't work (yet) with the Aerco Disk interface, and you can't have anything in the dock port. Which eliminates the Larken, also!!

The PLOTTER (Feb '89) has a QL cartridge Back up program listing. Also it has a n article called "2068 Large Printer Screen Dump". It is a m/c program listing.

That seems to just about wind things up for this newsletter. Do drop a line to the Editor! and do sit down and write up something for the newsletter!! Leaving you with that thought, I remain, Yours Sincerely,

George Chambers

*A member, Louis Laferrere has 5 2068 command cartridges to sell. ~~for~~ Flight Sim, Casino I, Budgeteer, Androids, Crazybugs. \$5 each.*

Les Cottrell  
108 River Heights Drive  
Cocoa, FL 32922

Dear Les,

Received your package about a week ago. Thank you for the return of the tapes.

I tried the program "survivor" and I was able to load it OK. It may have something to do with tape recorders. I'll have to check out Mario Bros as well. If I recollect it, I had some difficulty with it as well. That is to say, it would lock up.

Sorry that I did not include the games tape listing the last time. I shall try and remember it this time.

Funny, I hardly ever use the "erase.B1" utility. The ones that I use most are "doctor.B1", "copy12.B1", and "repair.B1". Well, come to think about it, I use them all. I think some of them are pretty clever, even if I do say so myself!!

Re your query on a disk of adventure games for the club library. I like the idea a lot, though I am a little fearful about letting the library get too big. The three disks that are in it already, are proving to keep me busy. Maybe it's the novelty of it, and so many Larken owners are interested in the Larken utilities. Maybe what I want to do is go at it cautiously. Provide a disk where it serves a purpose that tape cannot suffice.

To give you an idea of where it can lead to I include another games list, this one showing programs which are on disk, and/or on tape. Pretty staggering, isn't it!

You ask for some ground rules for club disks. Well, I know Larry Kenny says I should use Single sided disks, because some members have that type of drive. But I find that a bit restrictive. It may be OK for the Larken utilities disk that I have put in the library. But for others, I think that DS 40 tracks per side is most appropriate. Maybe I feel most strongly is this. That there is no point to simply duplicating the tape library. If a disk is to be put into the library, then there should be some valid reason. I have mentioned this before but maybe it bears repeating. That is, on tape, the programs have some natural order in terms of loading. That is to say, the code files are usually loaded by the immediately earlier Basic loader. On disk however, there is no such natural order. For all intents and purposes they are on the disk in random order, with no indication as to their grouping.

I feel that a disk of programs should have a front end menu, preferably of an AUTOSTART type, with a "menu.B1" backup. There should also be a HELP file, accessed from the menu, that describes the contents of the disk. What the programs are, which files go to make up each program; and how to use the programs once loaded. All very time consuming to prepare such a disk. But, given the higgledy-piggledy nature of our club tape library, I am not anxious to perpetuate it in the club disk library! Do these thoughts make sense?

Does that mean that I am interested in your "adventure" tape. Probably I am interested. Maybe you could send it to me, and I could take a look at it. I have an adventure game taken out of ZX COMPUTING, called Jack and the beanstalk. Based on the fairy tale. Do you have it?

Six milliseconds seems to be the standard as far as club members are concerned. I have not come across any other speed. I think Larry built the speeds in his DOS so that his system would be flexible. I've never run across a member who could not use that speed.

I think that either 10 or 9 tracks per NMI-save are both acceptable. If users want to make a 9 track save out of a 10 track, then they can. In my program "crackr.B1" I use the 9 track SAVE. I did that partly because I was initially working with 9-track saves. Then I decided to keep it that way; reasoning that users could make a 9-track save from their 10-track programs, and use that with the "crackr.B1" program.

Well, I shall close now and enclose this letter with our newsletter. We have a rather large newsletter this time. Seems that our members are being more helpful in contributing material for it. Our Editor does not like copying material from other newsletters, so he is lucky to have such cooperative members to send original stuff.

Sincerely,  
George Chambers
